

Lecture 11: Intro to Regressions & R Studio

Let's call the help function of library and see what happens.

```
help(library)
```

You can add a new chunk of code by clicking the *Insert Chunk* button on the toolbar or by pressing *Cmd+Option+I*.

When you save the notebook, an HTML file containing the code and output will be saved alongside it (click the *Preview* button or press *Cmd+Shift+K* to preview the HTML file).

The preview shows you a rendered HTML copy of the contents of the editor. Consequently, unlike *Knit*, *Preview* does not run any R code chunks. Instead, the output of the chunk when it was last run in the editor is displayed.

Let's take a quick look at how are notebook looks like right now.

We're going to cover:

Tidyverse - Packages for data wranglers

Tibble - Tibbles as dataframes

stringr - managing strings

Tidyr - pivot_longer: Pivot wide data into long format (i.e. "melt") - pivot_wider: Pivot long data into wide format (i.e. "cast") - separate: Separate (i.e. split) one column into multiple columns - unite: Unite (i.e. combine) multiple columns into one

Regressions:

- lm(): linear models
- Robust standard errors
- Binary Variables
- Interactions

Output:

- Stargazer
- Modelsummary

Tidyverse

So, as it turns out, you've already been working with a package within the Tidyverse!

tidyverse is a collection of packages. Many data scientists use it - and it's basically a bunch of packages written in similar style with a similar philosophy of approaching data structures.

This book is an additional resource to help you splice, groupby, mutate and dice up your data.

You can install this with

```
#install.packages("tidyverse")
```

and then load it up with

```
library(tidyverse)
```

```
## -- Attaching packages ----- tidyverse 1.3.0 --  
## v ggplot2 3.3.5      v purrr  0.3.4  
## v tibble  3.1.6      v dplyr  1.0.7  
## v tidyr   1.1.4      v stringr 1.4.0  
## v readr   2.1.1      v forcats 0.5.1  
  
## -- Conflicts ----- tidyverse_conflicts() --  
## x dplyr::filter() masks stats::filter()  
## x dplyr::lag()    masks stats::lag()
```

Once you have this loaded, you have the following packages included:

- dplyr (prior class)
- readr (prior class)
- tibble (this class)
- stringr (this class)
- tidyr (this class)
- ggplot2 (more on this later)
- forcats (not covered)

For importing, it also automatically imports a bunch of other packages that cover:

- DBI for relational databases. (Maintained by Kirill Müller.) You'll need to pair DBI with a database specific backends like RSQLite, RMariaDB, RPostgres, or odbc. Learn more at <https://db.rstudio.com>.
- haven for SPSS, Stata, and SAS data.
- httr for web APIs.
- readxl for .xls and .xlsx sheets.
- googlesheets4 for Google Sheets via the Sheets API v4.
- googledrive for Google Drive files.
- rvest for web scraping.
- jsonlite for JSON. (Maintained by Jeroen Ooms.)
- xml2 for XML.

A cheat sheet exists for A LOT of packages - you can take a look [here](#)

Tibble

Let's take a look at tibble. It is just a dataframe. Really not much to it.

The thing is, at first you will be annoyed. There will be a lot of errors that you are going to have to confront. The idea is that instead of R just figuring it out for you (such as columns automatically turned into strings where there are strings), it will show an error.

This is good. Because it makes you have to deal with issues with your data now - instead of dealing with an error that you don't know why it's giving you an error in a package or function later on.

Let's import the dataset that we'll use today - growth rate by country - using the R package WDI. Be sure to install packages as `install.packages(WDI)`

Honestly, tibble is pretty much a pandas data frame. It displays the first 10 lines and takes your data as is so that you can work from it from the ground up.

```
#install.packages("tidyverse", "wdi")
#notice that you can import a few packages in one line
library("WDI")
```

```
wdi <- WDI(country = "all", start=2000, end=2015, extra="TRUE",
           indicator=c("NY.GDP.MKTP.KD.ZG"))
```

```
wdi
```

```

```
wdi <-as_tibble(wdi)
```

#it's just that easy

A lot more about tibble can be found [here](#)

We can extract columns (as we did before and as in python) `df$columnname`

```
wdi$NY.GDP.MKTP.KD.ZG
```

```

## attr("label")
## [1] "GDP growth (annual %)"
```

Notice that Rstudio shows you all of the columns after you input the dollar sign.

dplyr plays nice with tibble Let's rename a column

```
wdi <- rename(wdi, gdp= NY.GDP.MKTP.KD.ZG)
```

Stringr

So, know that you are using tibble, you're going to need to know some basics of how to deal with strings.

It's particularly useful when you want to search or filter within a string.

In Python, if you assign an item a string, you can split, filter, etc. Typically, in pandas, we will assign a column a string or tell pandas we want string operations on a column (like `df['columnname'].str.replace(' ','')`)

This is not so dissimilar in R.

We use the function `filter` and apply the string detect function to search for a particular word (in this example)

```
wdi %>% filter(str_detect(wdi$country, "World"))
```

```
## # A tibble: 32 x 11
##   iso2c country      gdp year iso3c region capital longitude latitude income
##   <chr> <chr>      <dbl> <int> <chr> <chr> <chr> <chr> <chr> <chr>
## 1 1A Arab World 0.707 2009 ARB Aggreg~ "" "" "" Aggreg~
## 2 1A Arab World 5.90 2008 ARB Aggreg~ "" "" "" Aggreg~
## 3 1A Arab World 5.46 2005 ARB Aggreg~ "" "" "" Aggreg~
## 4 1A Arab World 9.07 2004 ARB Aggreg~ "" "" "" Aggreg~
## 5 1A Arab World 4.64 2007 ARB Aggreg~ "" "" "" Aggreg~
## 6 1A Arab World 3.06 2015 ARB Aggreg~ "" "" "" Aggreg~
```

```
## 7 1A Arab World 3.42 2013 ARB Aggreg~ "" "" "" Aggreg~
## 8 1A Arab World 4.73 2003 ARB Aggreg~ "" "" "" Aggreg~
## 9 1A Arab World 6.17 2006 ARB Aggreg~ "" "" "" Aggreg~
## 10 1A Arab World 4.78 2010 ARB Aggreg~ "" "" "" Aggreg~
## # ... with 22 more rows, and 1 more variable: lending <chr>
```

You can use these options to help you match specific cases

. to match any character (except a newline): ^ to match the start of the string. \$ to match the end of the string.

So, if we want to have countries that start with “United”, we can do this as:

```
wdi %>% filter(str_detect(wdi$country, "^World"))
```

```
## # A tibble: 16 x 11
##   iso2c country   gdp year iso3c region capital longitude latitude income

## # ... with 1 more variable: lending <chr>
```

Similar to pandas, you’ll often need to clean a column of strings or other symbols (particularly if it’s something you want to be integers). You’ll use the str_replace or str_replace_all

```
str_replace_all(df$columnname, "things to replace", "replace it with something")
```

#Don't forget to assign it!

```
wdi$gdp <- str_replace_all(wdi$gdp, "[,$!]", "")
```

A whole chapter to this that you should read is here

Tidy Data

R follows a set of conventions that makes one layout of tabular data much easier to work with. We usually call this format “Long”, and it will always have:

1. Each variable in the data set is placed in its own column
2. Each observation is placed in its own row
3. Each value is placed in its own cell

So, generally, you’re trying to get your data into that point. Luckily, there are a few commands to help you with this.

There are lots of ways to do this, though: `reshape()`, `melt()` [from wide to long], `cast()` [from long to wide], `gather()`[from wide to long], `spread()`[from long to wide]

But, we'll learn to transform data with `pivot_longer` and `pivot_wider`

Pivot wider

Now, let's try to pivot our data to the wide format.

When we pivot wider, it's going to look something like this:

```
wdi_wide <- wdi %>% pivot_wider(names_from=year,values_from=gdp)
wdi_wide

## # A tibble: 266 x 25
##   iso2c country iso3c region capital longitude latitude income lending `2009`

## # 2001 <chr>
```

Pivot Longer

We can transform the data into long format with the function `pivot_longer`.

It'll look something like this:

Before I pivot, I'm going to check the names of my columns to see what columns I need to transform.

```
names(wdi_wide)

## [1] "iso2c"      "country"    "iso3c"      "region"     "capital"    "longitude"
## [7] "latitude"   "income"     "lending"    "2009"       "2008"       "2005"
## [13] "2004"       "2007"       "2015"       "2013"       "2003"       "2006"
## [19] "2010"       "2002"       "2014"       "2012"       "2011"       "2000"
## [25] "2001"
```

```
names(wdi_wide) # checking the names of the columns to know what I should grab

## [1] "iso2c"      "country"    "iso3c"      "region"     "capital"    "longitude"
## [7] "latitude"   "income"     "lending"    "2009"       "2008"       "2005"
## [13] "2004"       "2007"       "2015"       "2013"       "2003"       "2006"
## [19] "2010"       "2002"       "2014"       "2012"       "2011"       "2000"
## [25] "2001"
```

```
pivot_longer(wdi_wide, c('2009':'2001'), names_to='year', values_to='gdp')
```

```
## # A tibble: 4,256 x 11
##   iso2c country   iso3c region capital longitude latitude income lending year

## # ... with 4,246 more rows, and 1 more variable: gdp <chr>
```

Separate

Another handy thing to learn in R is separate

let's say you have dates that you want to create two columns with. You can use the function separate to help you create two distinct columns in R.

```
stocks = read.csv("all_stocks_5yr.csv")
date_sep <- stocks %>% separate(date, into = c("year", "month", "day"), sep = '-')

```

#this arrows denote assigning an object - the direction of the arrow matters, but you can see the places

```
stocks %>% separate(date, into = c("year", "month", "day"), sep = '-') -> dat_sep

```

```
date_sep

```

```
##   year month day   open   high   low   close   volume Name

```

Unite

Separates sibling is Unite - where you can combine two columns into one.

```
date_sep %>% unite(date, c("month", "day", "year"), sep = "/")
```

Regressions

Now Let's get to running those regressions

The general format is that you will specify the model as the function and inside that function you will define the regression model that you want to run.

Stata's "reg" is R's "lm" which stands for linear model and is at the core of regression analysis.

The model will look something like this: `lm(y ~ x1 + x2 + x3 + ..., data = df)`

You can also call each of the columns within a dataframe like this: `lm(df$y ~ df$x1 + df$x2 + df$x3 + ...)` But, I prefer simplicity

Let's try running a basic OLS regression with our jobs dataset.

```
jobs = read.csv('/Users/mkaltenberg/Documents/GitHub/Data_Analysis_Python_R/Becoming a Viz Kid/job-autor
ols <- lm(prob ~ average_ann_wage + numbEmployed , data = jobs)
```

Alright, so we got a regression!

We can view some of the results in the stored item on the left. Or let's look into it with a function summary()

```
summary(ols)
```

```
##
## Call:
## lm(formula = prob ~ average_ann_wage + numbEmployed, data = jobs)
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -0.72928 -0.24991  0.06363  0.24745  0.92316
##
## Coefficients:
##              Estimate Std. Error t value Pr(>|t|)
## (Intercept)    9.213e-01  2.622e-02  35.130  <2e-16 ***
## average_ann_wage -6.971e-06  4.031e-07 -17.293  <2e-16 ***
## numbEmployed    1.168e-08  2.761e-08   0.423    0.672
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 0.3078 on 699 degrees of freedom
## Multiple R-squared:  0.3029, Adjusted R-squared:  0.3009
## F-statistic: 151.8 on 2 and 699 DF, p-value: < 2.2e-16
# if you want to remove a particular object, you can use the function rm()
rm(date_sep)
```

That's better! Ok, so, we can see all of our general statistics here. We can also view specific parts by using the dollar sign to indicate a part of the output we want to view

```
summary(ols)$coefficients
```

```
##              Estimate Std. Error   t value    Pr(>|t|)
## (Intercept)  9.212632e-01 2.622403e-02  35.1304979 1.484084e-156
## average_ann_wage -6.970858e-06 4.030936e-07 -17.2933997  4.776142e-56
## numbEmployed    1.167886e-08 2.761272e-08   0.4229523  6.724601e-01
```

You can run a subset of the data utilizing filter and grepl. NOTE the difference in the parenthesis.

The equivalent in stata would be: reg prob average_ann_wage numbEmployed if education != "No formal educational credential"

```
ols2 <- lm(prob ~ average_ann_wage + numbEmployed , data = jobs %>% filter(!(grepl("No formal educational credential", education)))
summary(ols2)
```

```
##
## Call:
## lm(formula = prob ~ average_ann_wage + numbEmployed, data = jobs %>%
##   filter(!(grepl("No formal educational credential", education))))
##
## Residuals:
##      Min       1Q   Median       3Q      Max
## -0.69748 -0.27219  0.03687  0.27719  0.90587
##
## Coefficients:
##              Estimate Std. Error t value Pr(>|t|)
## (Intercept)  8.863e-01  3.016e-02  29.383  <2e-16 ***

Robust standard errors

Often (like REALLY REALLY often) we want to include robust standard errors. In stata, this is an option in the command reg.

White Standard Error Adjustment (Robust standard errors) in Stata: `reg prob average_ann_wage numbEmployed, r`

In R, it's an entirely new function. So, let's import the package estimates

```
library(estimatr)

ols1_robust = lm_robust(prob ~ average_ann_wage + numbEmployed , data = jobs)
summary(ols1_robust)
```

```
##
## Call:
## lm_robust(formula = prob ~ average_ann_wage + numbEmployed, data = jobs)
##
## Standard error type:  HC2
##
## Coefficients:
##               Estimate Std. Error  t value   Pr(>|t|)    CI Lower
## (Intercept)      9.213e-01  2.860e-02  32.2078 3.044e-140  8.651e-01
## average_ann_wage -6.971e-06  4.705e-07 -14.8151 2.182e-43 -7.895e-06
## numbEmployed      1.168e-08  2.046e-08   0.5708 5.683e-01 -2.849e-08
##               CI Upper  DF
## (Intercept)      9.774e-01 699
## average_ann_wage -6.047e-06 699
## numbEmployed      5.185e-08 699
##
## Multiple R-squared:  0.3029 ,    Adjusted R-squared:  0.3009
## F-statistic: 113.5 on 2 and 699 DF,  p-value: < 2.2e-16
```

Binary Variables

Another thing you may want to do is include a dummy variable in your regression.

Generally, we consider this factors. In stata, you can include factors as `i.dummy_variable`

R makes this pretty easy - it automatically knows that you are using a string variable and will create categorical variables (factors) out of that.

```
ols_edu = lm_robust(prob ~ average_ann_wage + numbEmployed + factor(education), data = jobs)
summary(ols_edu)
```

```
##
## Call:
## lm_robust(formula = prob ~ average_ann_wage + numbEmployed +
##          factor(education), data = jobs)
##
## Standard error type: HC2

```

Interaction variables

There is a convenient syntax on how to include interaction terms:

x1:x2 "crosses" the variables (equivalent to including only the $x_1 \times x_2$ interaction term)

x1/x2 "nests" the second variable within the first (equivalent to $x_1 + x_1:x_2$)
x1*x2 includes all parent and interaction terms (equivalent to $x_1 + x_2 + x_1:x_2$)

Almost always you'll use * (all parent and interaction terms). There are situations in which you wouldn't, but it's rare.

So, let's check it out:

```
int = lm_robust(prob ~ average_ann_wage + numbEmployed*education, data = jobs)
summary(int)
```

```
##
## Call:
## lm_robust(formula = prob ~ average_ann_wage + numbEmployed *
##           education, data = jobs)

Output

There are a LOT of packages out there to export and display various statistical results. You can take a look at them [here](#)

There are very few that export directly to word (flextable and huxtable) - rather, you would export html output and then copy and paste it into word or for a presentation or export a pdf from R markdown for a presentation. The reason that there are such few packages that export to word is because it's a nightmare of bugs. Also, most researchers using R/Python use LaTeX for formatting, thus most packages export to LaTeX quite easily.

We will focus on two of them that make output in a variety of formats easy and pretty - stargazer and modelsummary.

Stargazer

Most people who use R for data analysis use stargazer as a way to present regression tables and summary statistics. It is by far the most popular package for this - possibly because it's so easy to use the output looks very nice

```

## </table>
```

We can easily see the regression when we directly input the code in R Markdown

There are many options within stargazer that we can play around to get our tables “just right” - and you will spend a lot of time doing this. Every researcher spends more time than they like to get their tables correct.

A very useful cheat sheet on stargazer can be found [here](#)

```
##  
## % Error: Unrecognized object type.  
## % Error: Unrecognized object type.
```

Model Summary

Model Summary is a quick and easy way to export and view regression tables.

And summary statistics:

```
## Loading required package: kableExtra  
##  
## Attaching package: 'kableExtra'
